C GENERAL INFORMATION

APPLICANT: YAMADA, HIDEAKI

APPLICANT: NAGASAWA, TORU

APPLICANT: NAGASAWA, TORU

APPLICANT: NISHIYAMA, MAKATO

TITLE OF INVENTION: DNA FRAGMENTE ENCODING A POLYPEPTIDE

TITLE OF INVENTION: GENE AND A PROCESS FOR THE PRODUCTION OF AMIDES USING TITLE OF INVENTION: TRANSFORMANT

TITLE OF INVENTION: GENE AND A PROCESS FOR THE PRODUCTION OF AMIDES USING TITLE OF INVENTION: GENE AND A PROCESS FOR THE PRODUCTION OF AMIDES USING TITLE OF INVENTION: TRANSFORMANT

NUMBER OF SEQUENCES: 15

CORRESPONDENCE ADDRESS:

ADDRESSEE: PENNIE & EDMONDS

STREET: 1155 AVENUE OF THE AMERICAS

CITY: NEW YORK

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FEBS Lett. (1995) 365:183-188
Primary structure and expression of a novel human laminin alpha-4 chain.
                                        chains that arise by cleavage of the precursor. Activity is regulated by phosphorylation of serine and tyrosine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                *binding_site carbohydrate (Asn) (covalent) *status

interact with cells and with other basement membrane proteins to promote differentiation, development, and cell migration *superfamily laminin alpha-4 chain; laminin G repeat homology; laminin-type EGF-like homology; laminin-type EGF-like homology basement membrane; cell binding; colled coll; extracellular matrix; glycoprotein; heptad repeat; heterotrimer
                                                                                                                                                                                                                                                                                   submitted to the EMBL Data Library, February 1993
Isolation of a partial cDNA encoding a protein homologous to
laminin A. Assignment of the gene to chromosome 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           #domain laminin-type EGF-like homology #label LEI\

##experimental_source F9 embryonal carcinoma cells
This protein is a cytoplasmic calcium binding protein which lacks
EF-hand motif, and is present in embryonal carcinoma cells. It
plays important roles in requiation of cellular activities. This
protein is rich in hydrophilic amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

protein - protein database search, using Smith-Waterman algorithm MPsrch\_pp

Thu Oct 21 15:47:36 1999; MasPar time 2.43 Seconds 116.421 Million cell updates/sec Run on:

(1-10) from US09040485.pep Tabular output not generated.

1 QENPDSSEPV 10 Description: Perfect Score: Sequence: PAM 150 Gap 15 Scoring table: Searched:

77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

Statistics:

swiss-prot37 1:swissprot

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 21.064; Variance 21.885; scale 0.963

HPRC IS A FORM OF INHERITED KIDNEY CANCER CHARACTERIZED BY A PREDISPOSITION TO DEVELOP MULTIPLE, BILATERAL PAPILLARY RENAL TUMORS. THE PATTERN OF INHERITANCE IS CONSISTENT WITH AUTOSOWAL DOMINANT TRANSMISSION WITH REDUCED PENETRANCE. SIMILARITY: BELONGS TO THE MET TYROSINE KINASE FAMILY OF RECEPTOR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TCCCALIZATION Of the gene (LAWA4) to chromosome 6q21 and isolation of a partial cDNA encoding a variant laminin A chain.";

C. 1- CEANIZATION SINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ TO THE STREAM ATRIX COMPONENTS.

C. 1- FUNCATION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ ES THOUGHT TO MEDIATE THE ATTACHMENT, MIGRATION, & ORGANIZATION OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.

C. 1- SUBGNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLYEPETIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END.

C. SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT).

C. SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN THE BASEMENT MEMBRANES (MAJOR COMPONENT).

C. TISSUE SPECIFICITY: IN ADULT, STRONG EXPRESSION IN HEART, LUNG, OVARY SMALL AND LARGE INTESTINES, PLACENTA, LIVER; WEAK OR NO CATAIN HISTORY MASSOCIAL MASSOCIAL MUSCLE AND DERMIS.

C. TISSUES SUCH AS SWOOTH MUSCLE, AND THE ALPHA-HELICAL DOMAINS.

C. THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ GIAINS OF SORM A COLLED COLL STRUCTURE.

C. TO DOMAIN: THE ALPHA-HELICAL DOMAINS.

C. TO DOMAIN: THE ALPHA-HELICAL DOMAINS.

C. TO DOMAIN: THE ALPHA-HELICAL DOMAINS.

C. SIMILARITY: CONTAINS 5 LAMININ GFLIKE DOMAINS.

C. SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.

C. SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.

C. SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.
